

The figure consists of two side-by-side plots, each showing a distribution of points within a complex, elongated, and somewhat hourglass-shaped region. The region is defined by a black outline. The background of both plots is white with a light gray grid. The left plot contains red points, while the right plot contains cyan points. The points are scattered throughout the region, with a higher density in the upper and lower wider sections and a lower density in the central narrower section. The overall shape is roughly symmetrical about a vertical axis.
